

# Bringing Flamegraphs to MySQL Query Optimization

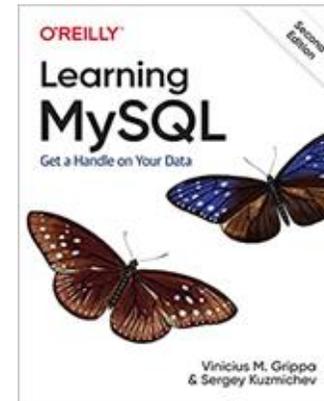

Vini (Vinicius) Grippa

*Lead Database Engineer at Percona*

# SELECT \* FROM person where name like 'Vini';

- Database Engineer at Percona for 8 Years. Working mostly with MySQL and MongoDB
- Co-author of the Learning MySQL book
- Organizer of the Brazilian MySQL Community

# Why I'm Here (Besides the Belgium Beers)

- What is a flamegraph
- Why flamegraphs are useful
- Traditional flamegraph use cases
- New MySQL explain features
- Myflames: concepts & examples
- Flamegraphs vs bar graphs

What is a flamegraph

# What is a flamegraph

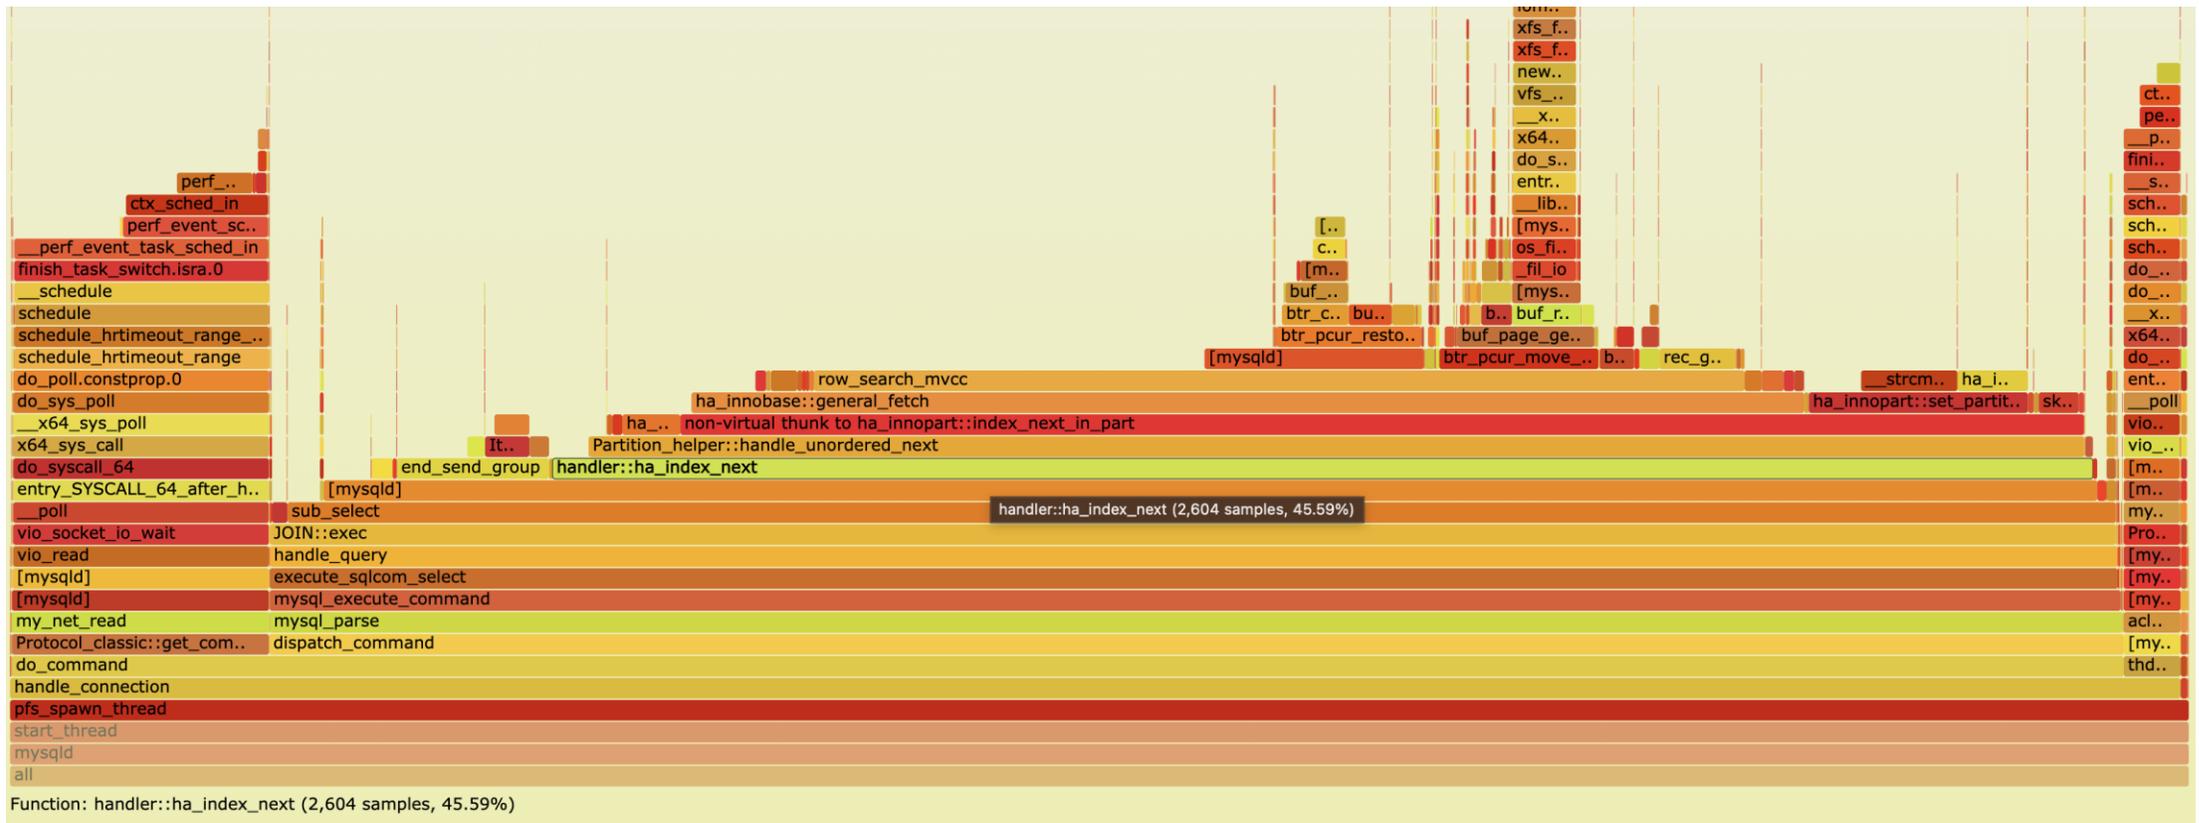

- Visualization technique for hierarchical performance data
- Created by Brendan Gregg to analyze system performance
- Represent stack traces aggregated over time
- X-axis: where time is spent (not time sequence)
- Y-axis: call stack depth / hierarchy
- Each box = function or operation
- Wider boxes = more time / higher cost
- Designed to quickly answer: “Where is the bottleneck?”

Why flamegraphs are useful

# Why flamegraphs are useful

Traditional Flamegraphs use  
cases

# Traditional Flamegraphs use cases

- CPU profiling and hotspot analysis
- Identifying expensive function calls
- Application performance tuning
- Kernel and OS-level analysis
- I/O, memory, and scheduler behavior
- Comparing performance before vs after changes
- Regression detection in performance tuning

**Mostly focused on code paths**

# New MySQL explain features

# New MySQL explain features

- We had until MySQL 8.4:
- **EXPLAIN <query>;**
- **EXPLAIN FORMAT=JSON <query>**
- **EXPLAIN FORMAT=TREE <query>**
- **EXPLAIN ANALYZE <query>**

# New MySQL explain features

- `mysql> EXPLAIN ANALYZE FORMAT=JSON SELECT * FROM employees.employees WHERE last_name = 'Facello' AND first_name = 'Georgi';`
- `ERROR 1235 (42000): This version of MySQL doesn't yet support 'EXPLAIN ANALYZE with JSON format`

# New MySQL explain features

- <https://dev.mysql.com/blog-archive/new-json-format-for-explain/>
- `mysql> SET explain_json_format_version=2;`
- `mysql> EXPLAIN ANALYZE FORMAT=JSON SELECT * FROM employees.employees WHERE last_name = 'Facello' AND first_name = 'Georgi';`

# New MySQL explain features

# Tanel Poder

**SQL Plan Execution FlameGraphs with  
Loop and Row Counts**

# SQL Flamegraph

# Myflames

- Developed using Cursor AI
- Based on Tanel Poder flamegraph

# Myflames

- DEMO
- ```
EXPLAIN ANALYZE FORMAT=JSON SELECT * FROM employees.employees WHERE last_name = 'Facello' AND first_name = 'Georgi';
```

# Myflames

- DEMO
- ```
EXPLAIN ANALYZE FORMAT=JSON /* Employees with more than one title
historically */ SELECT e.emp_no, e.first_name, e.last_name, COUNT(t.title) AS
total_titles FROM employees e JOIN titles t ON e.emp_no = t.emp_no GROUP BY
e.emp_no, e.first_name, e.last_name HAVING total_titles > 1 ORDER BY
total_titles DESC LIMIT 10;
```

# Myflames

- It supports all flamegraphs commands
- Published on GitHub

# Flame graphs vs Bar graphs

# Bonus – Bargraph

- DEMO
- ```
EXPLAIN ANALYZE FORMAT=JSON /* Employees with more than one title
historically */ SELECT e.emp_no, e.first_name, e.last_name, COUNT(t.title) AS
total_titles FROM employees e JOIN titles t ON e.emp_no = t.emp_no GROUP BY
e.emp_no, e.first_name, e.last_name HAVING total_titles > 1 ORDER BY
total_titles DESC LIMIT 10;
```
